SPRING 2010

## New Skills and Interests!

In January of this year Vet **Marcelle Cassar** joined our team of now seven Vets. Marcelle, who qualified from Liverpool University in 1986 is a familiar face at Highgate Vets as she has helped us by working as a locum to cover maternity leave in the past. We have benefitted from her medical and surgical expertise and are pleased to welcome her on a permanent basis three days a week.

At work her particular interests are surgery, dermatology and dog/cat behaviour. When not working she enjoys the outdoors, cycling and walking with her two dogs Lottie (a Pointer x Labrador) and Winston (a Bearded Collie). She also keeps chickens and has two tortoises, bringing the number of tortoise owning staff in the practice to three!

### Consulting Times

#### By Appointment

*Monday - Friday*

9.00 - 10.30 am,  
2.00 - 3.00 pm,  
4.30 - 5.30 pm,  
6.00 - 7.30 pm

*Saturday*

9.00 - 10.00 am,  
12.00 - 12.30 pm

☎ (01539) 721344

### Also in this issue:

- *Rabbits – keeping one jump ahead!*
- *Parasites: Spring into action!*
- *Kidney disease: Is my pet affected?*

## Skin Deep!

With Spring here at last, the longer days and warmer weather can signal the start of the allergy season for many. And it's not just us who can be affected by allergies, our pets can suffer too.

### What are the signs of allergies in pets?

Whilst our pets aren't likely to sneeze when confronted with a field full of grass and pollen, they can suffer from skin irritation. Common signs of allergy include sore, red, itchy skin, hair loss and inflamed ears or feet.

### Can allergies be cured?

Unfortunately allergies cannot be cured, but the good news is that they can normally be well managed. BUT this depends on correctly identifying **1.** The underlying allergen and **2.** The many complicating factors such as bacterial infections, hormone problems, harvest mites, yeast infections, and skin damage.

Sometimes there is a single cause of the allergy such as flea bites but often common allergies include pollens, house dust mites, and food allergy. Some dogs and cats may be allergic to several different things! So giving relief to the itchy dog can be far from simple.

Fortunately at **Highgate Vets** we have vets who are interested and skilled at dealing with these problems in depth.

After a detailed examination and questions about your pet's lifestyle we may feel that further tests are indicated. These can include **skin scrapings** to look for mites, "**surface cytology**" to look for bacteria and yeasts, **biopsy** of the skin to look at disease processes. We may ask you to perform a **diet trial** to help eliminate food as a cause of the allergy.

Indeed ruling out the many causes is the key to success and only when all the other causes have been eliminated can we make a diagnosis of Atopy (or pollen/dust allergy) which can be checked with a **blood sample**.

**Treatments** are as varied as the causes and range from antibiotics and shampoos to essential oil supplements, antihistamines, anti-inflammatory injections, creams and sprays to desensitising vaccines. So if Spring spells trouble for your pet's skin don't delay ask our expert advice and bring pet and owner some relief.

## Don't get caught out by the cough!

**KENNEL COUGH**, otherwise known as infectious bronchitis, is a highly contagious disease of the dog's respiratory tract. The cough is passed from dog to dog wherever they meet – out on walks, on the beach in the summer, at training classes, dog shows and of course boarding kennels!

Dogs of all ages can be affected and signs include a harsh, dry, whooping-type cough. Whilst some dogs recover relatively rapidly, others may cough for weeks and some may get more serious complications such as pneumonia.

Prevention is much better than cure, because without vaccination, treatment of kennel cough can be a costly and lengthy process involving isolation and antibiotic therapy. Kennel cough is caused by a mixture of viruses and a bacterium – *Bordetella bronchiseptica*. At **Highgate Veterinary Clinic** we strongly recommend that dogs are vaccinated before staying in a boarding kennels and at any other time when the disease is rife with **Nobivac KC** nasal drops. Please contact us for an appointment today!

## Rabbits – keeping one jump ahead!

LIKE other pets, your rabbit needs to visit us from time to time for a routine health examination and vaccinations. Here we look at some of the health issues facing pet rabbits.

**Vaccination** With the onset of warmer weather, now is the time to ensure your rabbit is vaccinated. Vaccination primes your rabbit's immune system to recognise and defend against incurable and life threatening infectious diseases – specifically Myxomatosis and Viral Haemorrhagic disease.

- **Myxomatosis** is a distressing viral disease spread by rabbit fleas, mosquitoes and other blood sucking insects. Affected rabbits typically suffer from swollen eyes, leading to blindness and death in most cases.

- **Viral Haemorrhagic Disease (VHD)** is another very serious viral infection. It spreads easily between rabbits or via contaminated hutches, bedding or food. Infected rabbits may show a variety of signs including nose bleeds, loss of appetite and lethargy. Sadly most will die despite treatment.

Happily we are now able to offer you protection against both of these deadly infectious diseases – please contact us now to arrange a health check and vaccination.

**Flystrike** is a really big problem in rabbits during the warmer months. Rabbit rear ends often become damp and this moist area attracts flies, which lay their eggs there. These eggs hatch out into maggots, which are capable of burrowing through the rabbit's skin and into the underlying flesh. Rabbit rear ends should be inspected **daily** for fly eggs and maggots. Soiled bedding should also be removed on a daily basis to minimise flies being attracted to the hutch.

Please don't hesitate to ask us for further information on these or any other health issues affecting your rabbit.

### Tooth problems

You may be surprised to learn that dental disease is a very common health problem in rabbits. Rabbits have *continuously growing* teeth, with both the cheek teeth and the incisor (front) teeth growing by as much as 1-2 mm per week!

This enables wild rabbits to graze *all day* on grass and other abrasive foods without wearing out their teeth!

Equally, feeding your pet rabbit the correct diet is very important. Their ideal diet includes plenty of hay (high in fibre), together with a selection of fresh food and a small amount of commercial rabbit food.

Feeding a high fibre diet will help to reduce the incidence of *overgrown* cheek teeth (arrowed) These are sharp and lacerate the gums.

High fibre diets promote dental health, reduce obesity and keep them occupied for several hours each day! Commercial rabbit foods are now available as extruded pellets and this helps to avoid the problem of rabbits selectively feeding – leaving vitamins and minerals uneaten.

## Kidney disease Is my pet affected?

THANKFULLY most of our pets lead healthy active lives. However for some, kidney disease can be a problem and it is particularly prevalent in older pets (especially cats).

Dogs and cats have two kidneys and each kidney has several hundred thousand tiny filters called **nephrons**. These filter the blood, removing toxic waste products, salts and water which are then concentrated to form urine.

Over time a proportion of the nephrons will disappear with age and not be replaced. Other factors such as toxins, infections or cancer may also destroy nephrons.

However, the kidneys have *excess* filtering capacity with the result that *visible* symptoms of kidney disease are not usually seen until roughly two thirds of the nephrons have been lost. If this stage is reached the filtering capacity falls and toxic wastes begin to accumulate in the blood. Common symptoms include **increased drinking and increased urination, weight loss, muscle wastage, lack of appetite and lethargy**.

With regular veterinary check-ups the symptoms of kidney disease can often be detected at an earlier stage – *before* they become outwardly noticeable. So don't delay – if your pet is showing *any* symptoms of kidney problems, please see us for a check-up. Whilst kidney disease cannot be cured, a combination of specially formulated diets that reduce the workload of the kidneys, together with novel forms of medication, can often significantly improve the quality of life for affected pets.

## Parasites: Spring into action!

THE warmer months are peak season for pesky parasites and two of the most annoying are fleas and ticks!

**Fleas** need little introduction to most pet owners! Adult fleas are 2-3mm in length and can be seen without magnification. These tiny

wingless insects survive by feeding on your pet's blood, causing very intense irritation and sometimes allergic skin disease. Fleas also play a major role in transmitting tapeworms in dogs and cats.

**Ticks** tend to be a problem in the warmer months and commonly live in areas of heathland, moorland and woodland, waiting to attach themselves to passing animals. Ticks feed on your pet's blood and can cause problems in two ways – firstly they can cause a tissue reaction at their site of attachment and secondly they can transmit serious diseases such as Lyme disease and Babesiosis.

Don't let fleas and ticks make your life a misery – Please let us advise you on the best form of flea and tick control for *your* pet!

### What to look for when you groom your pet's coat

Specks of flea "dirt" (flea faeces) in the coat are easy to find

Parting the coat reveals a tick in situ with buried mouth parts
